

## Backend position home assignment

Create a backend service using Strapi (version 4 and above) to meet following requirements:

1. It should have a collection type called Messages
2. Messages should have a relation with users' table
3. Provide a document for explaining how to get, create and delete the messages
4. The APIs for getting and creating messages should be written manually and not using the Strapi's default APIs
5. Any user should have access to only their own messages and no other users' messages
6. **Bonus:** Implement Authentication system using third parties like: Firebase, Auth0, etc.
7. **Bonus:** Provide a link to the live version of your code

Please don't consume more than 8 hours to completing this task and we expect you to complete it in less than a week.

When you completed the task, please send us the link to public repository of your code on GitHub or GitLab.

Feel free to ask any questions you have for this task via email or my phone number.
